Website design, SEO & GEO · work sample by Baver Ok

THE PROJECT

A multi-page WordPress site for a Belgian youth chess champion — built from an empty domain to a complete, search-optimised presence. I handled everything: site structure, design, content, technical SEO and the social media integration.

WHAT I BUILT

- Full multi-page site in WordPress using Elementor and the Astra theme — structure, layout, responsive design and all page content.
- Instagram and Facebook integration so tournament news reaches the site and the social channels together.

SEO & GEO WORK

- On-page SEO across every page: titles, headings, internal linking and keyword-targeted copy.
- Structured data in JSON-LD, including SportsEvent markup for tournaments and FAQPage markup, so results can appear as rich results rather than plain links.
- Entity and knowledge-graph markup to connect the player to the wider chess entity graph — the groundwork search engines and AI assistants use to identify who someone is.
- An llms.txt file so AI-powered search engines can read and cite the site correctly (GEO/AEO), not just traditional crawlers.
- Iterative technical SEO/GEO audits, fixing issues and re-auditing each round.

RESULT

The iterative audit cycle measurably raised the site's overall search-health score, and the site now serves as the player's primary online presence — visible both in traditional search and to AI-powered search engines.

WHY IT'S RELEVANT

This project is where I taught myself the work I now do professionally at Episto: writing clear content for a real audience, publishing and maintaining it in WordPress, and making sure it can actually be found. I ran it end to end — no brief handed to me, no team to hand it off to.
